

# I.S.S. Integrated Steering System

## Mamba Prestige

The Mamba Prestige™ transmits the drive from the steering wheel via bevel gears to either BH 10, 125 or 150 transmission systems as described in this catalogue and will cover craft from 40' to 140' L.O.A. with single or dual station steering positions. Whilst more expensive initially than the traditional wire or hydraulic systems, it offers the ultimate in performance and reliability for those who put steering quality high on their list of priorities.

The space frame is clad with high strength injection G.R.P. moulded panels for style and durability. Practically however they are rapidly removable to gain access to the steering and autopilot mechanism for installation and servicing. A wiring loom for the instrumentation is fed through the pedestal and is immediately accessible.

The I.S.S.™ range combines the best in modern aesthetic design with strength, safety and durability. Its modular construction allows it to be built up to specific requirements — even the aft console in an option.
